

HYDRANTS AND SPRINKLER SYSTEMS

Most vendors will sell you lifesaving products without telling you about their sourcing techniques. These crucial devices could have been procured from dubious, sub-standard sources. These vendors do not adhere to any standards of installation and maintenance, leaving you with a half-finished, low quality installation of a safety device that does nothing more than give you a false sense of safety.

Ceasefire's Hydrants and Sprinkler Systems are designed to successfully fight large fires (particularly Class A) in commercial premises such as malls, factories and cinema halls. These systems are UL / EN certified. Every component, according to the project's requirements, is sourced through tie-ups with best-in-class manufacturers from around the world. What's more, these systems are designed and installed with strict adherence to the NFPA guidelines.

To rule out substandard execution by street corner technicians, we do not outsource the assembly of our Hydrants and Sprinklers. These lifesaving devices are assembled by our very own specialised unit. From planning the system to installing it in the right place in your premises. From commissioning to welding. The unit does everything there is to do in the process. All under the supervision of a highly trained Ceasefire Supervisor. This Project Management System helps the division deliver quality products, on time.

And finally, ICCU, Ceasefire's annual maintenance arm ensures that these systems are always on guard, ready to protect lives when a fire breaks out.
